# Focus on the Mission

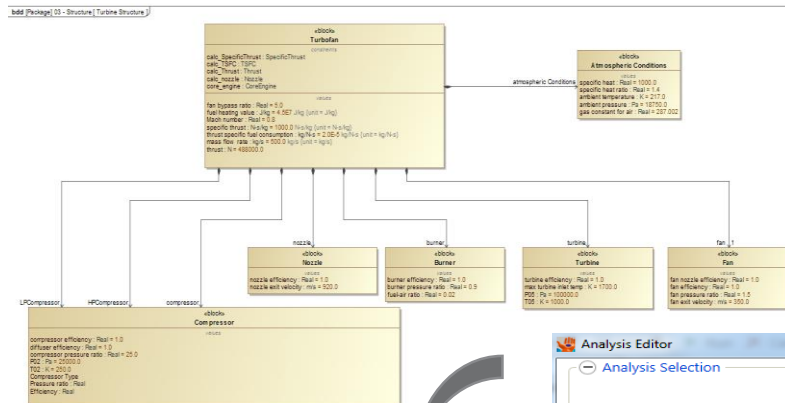

Assessing all representations of your system across the lifecycle relative to common mission-level requirements accelerates capability delivery

*System Engineer view of a state machine in a SysML authoring tool*

*Behind the scenes view of ModelCenter Enterprise simulating the signalDetected transition*

Simulation tools such as STK assess if the signalDetected condition is satisfied using precise event-based timing and native algorithms

ModelCenter Enterprise

Simulate and optimize SysML-defined *behavioral* characteristics of the satellite system relative to system performance requirements.

For example, are the satellite's data caching behaviors adequate to handle communication degrade scenarios that evolve during the course of particular operational scenarios?

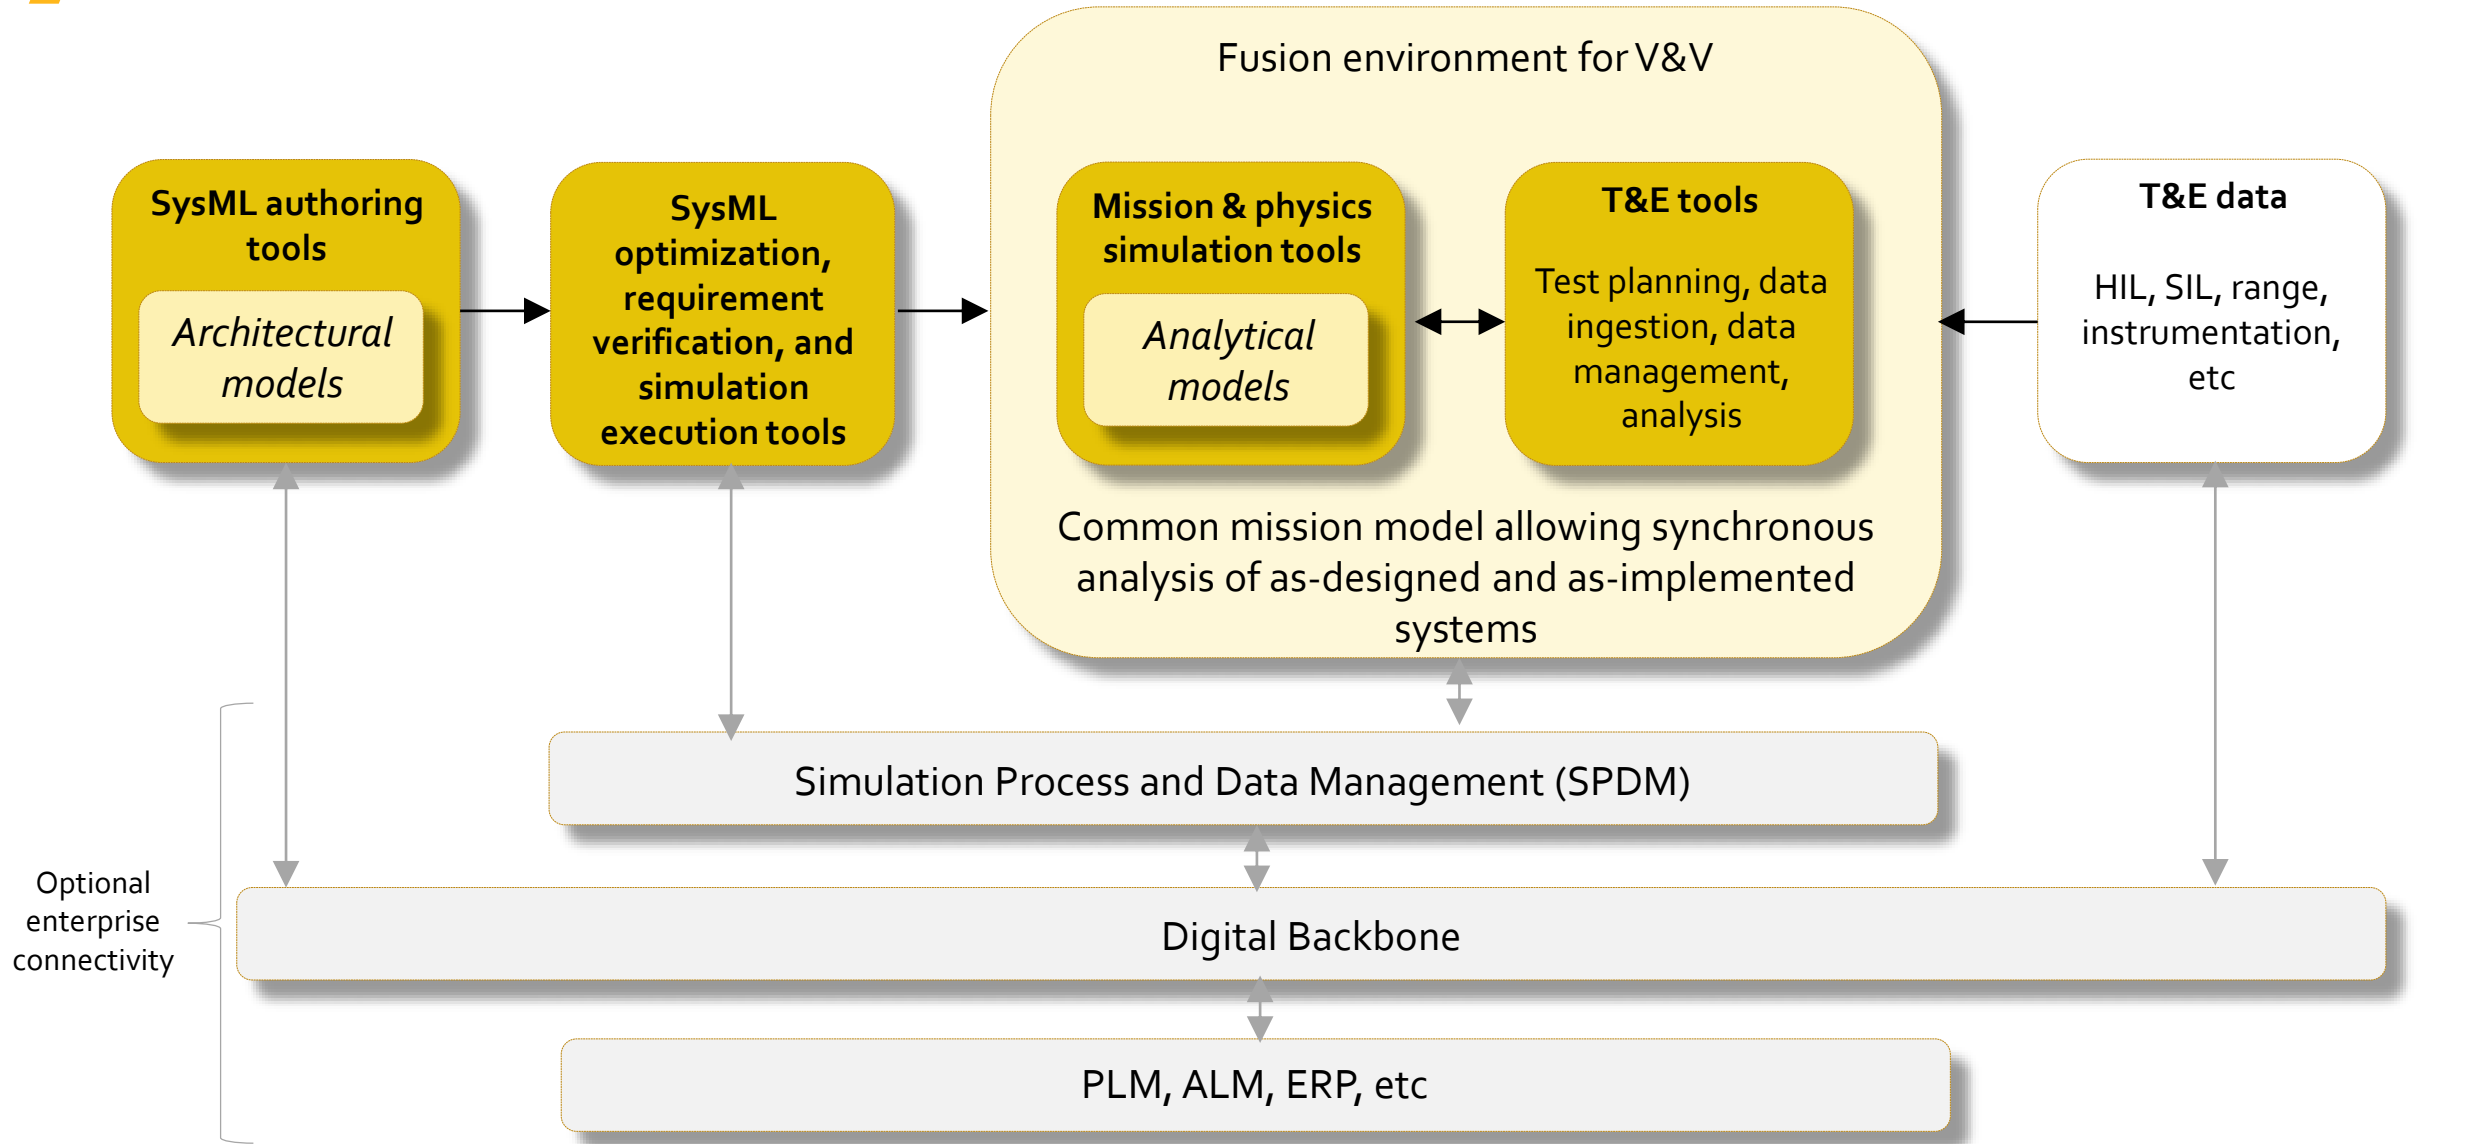

Simulate and optimize SysML-defined *physical* characteristics of the satellite system relative to system performance requirements.

For example, is the gain pattern provided by a particular antenna design adequate to satisfy communication relay requirements in particular operational scenarios? Does the cost model for this antenna meet budget constraints?

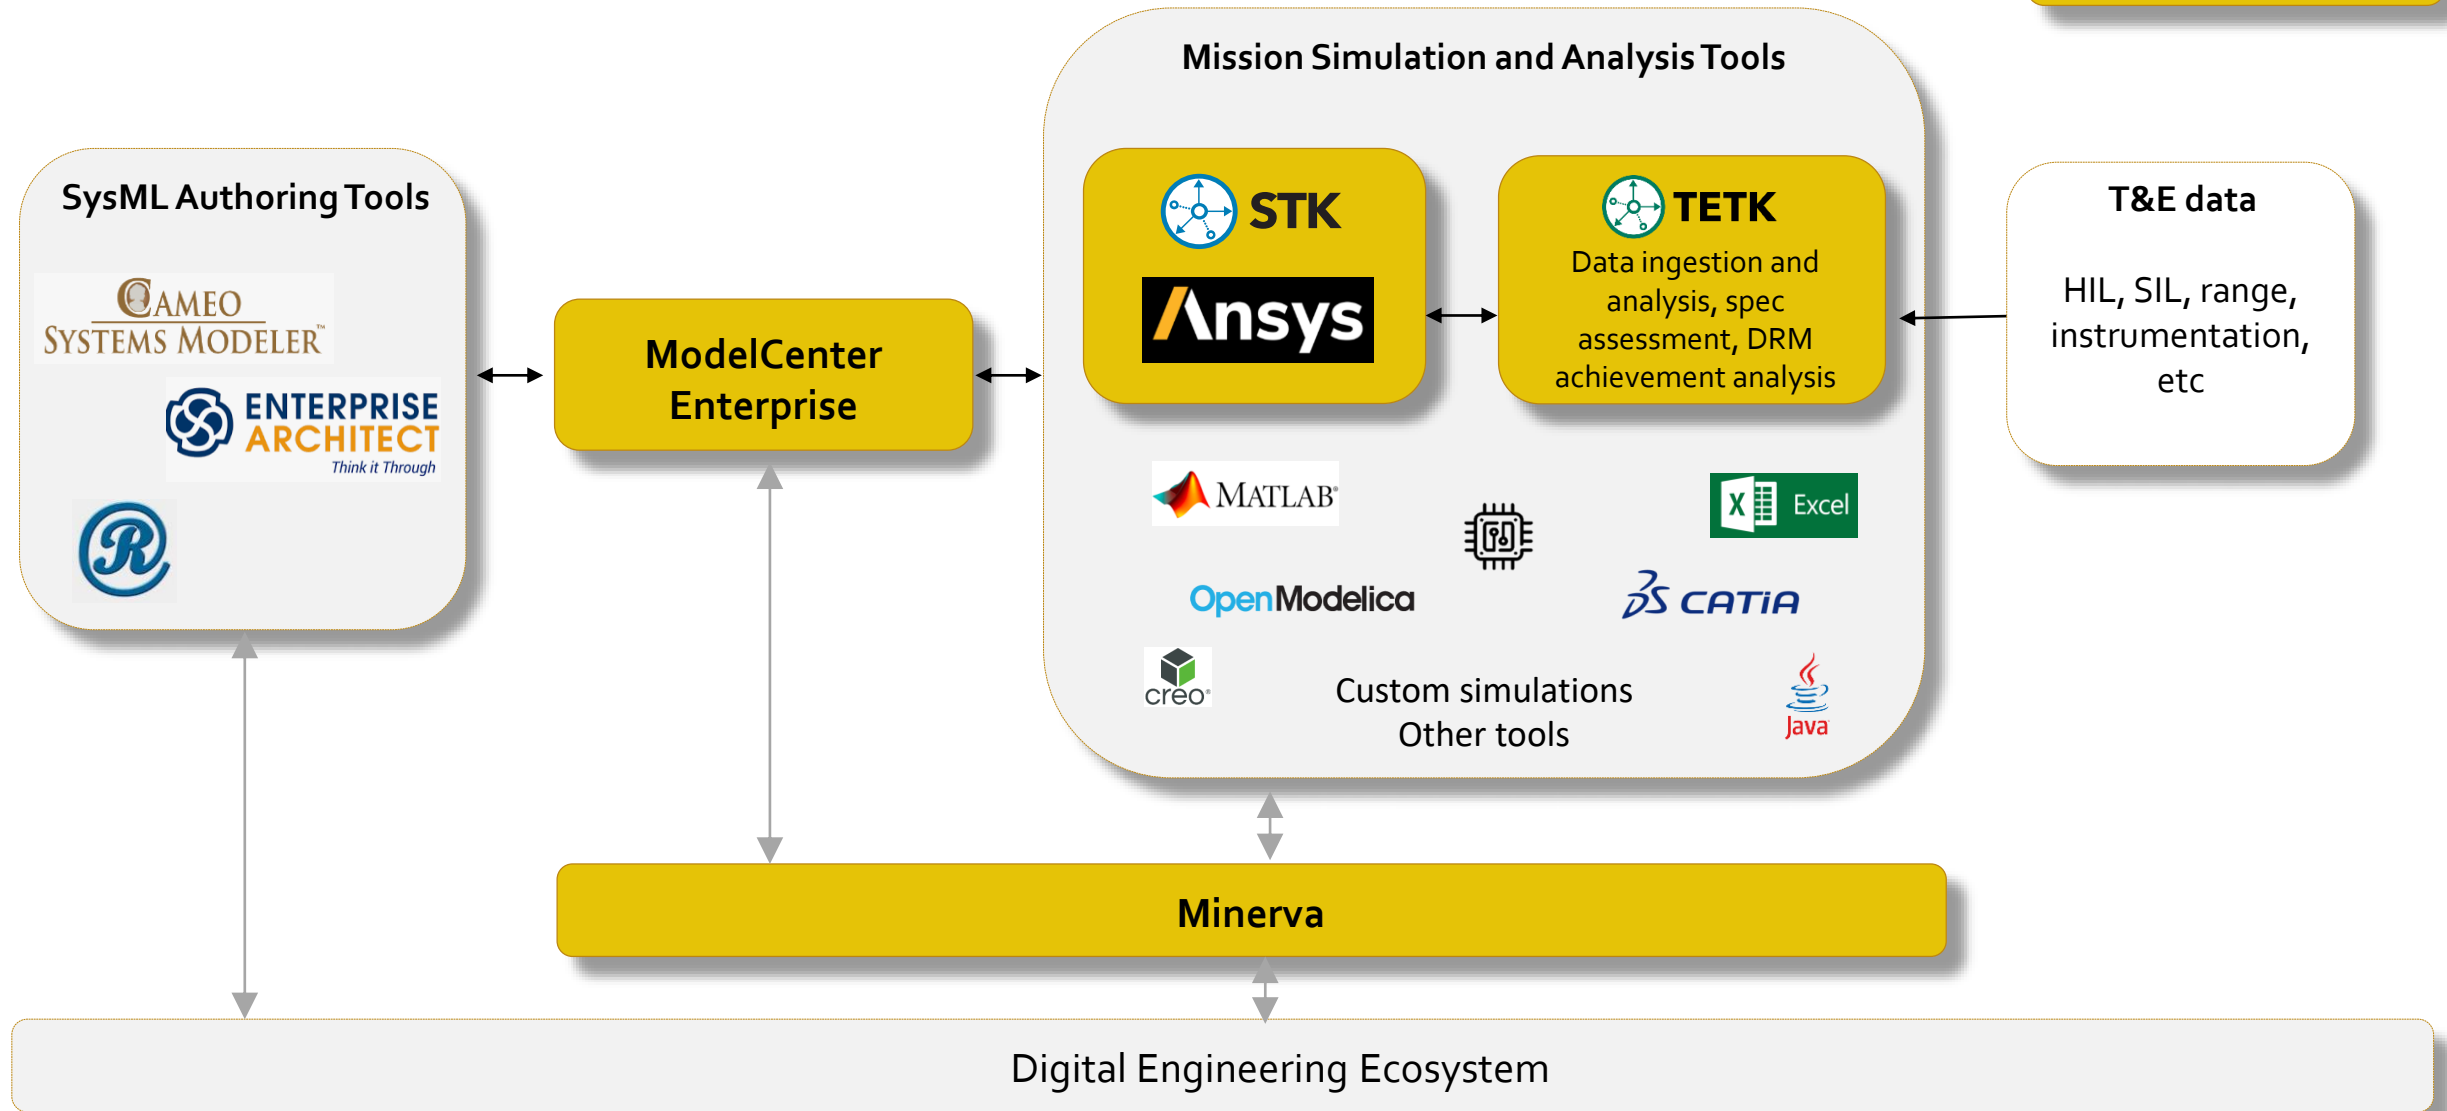

Analytical models and operational scenarios  
modeled in tools such as STK or MATLAB
